Art Unit: 2823

DETAILED ACTION

- Applicants' arguments discussed in interview on 01/10/2003 were found persuasive.
- 2. The rejection of claims 1-9 and 22-37 under 35 USC § 103 is withdrawn.
- 3. A new rejection is made as set forth in the office action.
- 4. Claims 1-9 and 22-37 are pending in the application.

Claim Rejections - 35 USC § 112

- The following is a quotation of the second paragraph of 35 U.S.C. 112:

 The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 6. Claim 26 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. In reference to claim 26, applicants recite, "... wherein said desirable high frequency electrical characteristics include thin substrate-determined electrical parameters within said integrated circuit device...". This renders the claim indefinite, since it fails to further limit the invention.

Claim Rejections - 35 USC § 103

- 7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

. .

Art Unit: 2823

8. Claims 1-7, 9, 31-34 and 37 are rejected under 35 U.S.C. 103(a) as being unpatentable over Morcom et al. (U.S. 6,162,702) in view of Goldstein (U.S. 5,528,080) alone or in combination with the Applicants' Admitted Prior Art.

In reference to claims 1, 31, 33, 34 and 37, Morcom et al. (1A-6) in a related method to form ultra thin silicon wafers teach disposing a grid pattern (4, 5) on the backside of a silicon wafer (2) comprising silicon; said grid pattern mask (4, 5) including a backside periphery outline masking for each circuit die of said wafer (2); and removing a layer (1) of selected thickness form said wafer backside surface, wherein said removing being from exposed backside surface areas intermediate elements of said grid pattern masking (4, 5), wherein said removing step leaving recessed valley portions of selected thickness disposed intermediate individual circuit die-strengthening upstanding (3) surrounding bluff masked semiconductor regions in said wafer backside surface (column 2, line 15 – column 3, line 45).

Morcom et al. fail to expressly teach forming an array of via holes of selected location and depth dimension in said wafer of circuit die; said step of forming an array of via holes being performed during a front side accessing of said wafer of circuit die; metallizing said via hole openings, said metallizing including establishing via metal electrical connections with selected contact pads; and disposing the mask pattern on the back side of a microwave radio frequency die. However, Goldstein (Figs.7-11 and Figs.17-20), in a related method to form semiconductor integrated circuit dies teaches forming an array of via holes (84) of selected location and depth dimension in a wafer (91) of circuit die; metallizing said via hole openings (84), said metallizing including

Art Unit: 2823

establishing via metal electrical connections (87) with selected contact pads (85). wherein said step of forming an array of via holes (84) being performed during a front side accessing of said wafer (91) of circuit die; and disposing a mask pattern (not shown) on the back side of said die (column 9, line 6 – column 10, line 39). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Morcom et al. and Goldstein to enable forming the circuit configuration of Goldstein in the wafer of Morcom et al. to arrive at the claimed invention.

Furthermore, by combining the teachings of Morcom et al. and Goldstein, semiconductor dies with improved support and reduced thickness can be used for the fabrication of microwave radiofrequency dies as taught by the prior art (Instant page 1, line 16 – page 2, line 14).

In reference to claim 2, the combined teachings of Morcom et al. and Goldstein teach wherein said wafer has an initial thickness between five hundred and six hundred twenty five micrometers and has a final thickness of between twenty five and one hundred micrometers in said removed layer recessed valley portions (Morcom et al., column 3, lines 7 - 18).

In reference to claim 3, the combined teachings of Morcom et al. and Goldstein teach wherein said step of forming an array of via holes is performed after fabrication of said microwave radio frequency circuit on said die (Goldstein, column 9, line 6 – column 10, line 39).

Art Unit: 2823

In reference to claim 4, the combined teachings of Morcom et al. and Goldstein substantially teach all aspects of the invention by fail to show forming an etching step vernier marker pattern in each die backside surface of said wafer after said step of forming an array of front side via hole. However, portion of the ridges in Morcom et al. (see Fig.6) could perform the function required of by recitation of "vernier markers", which is a label or statement of intended use.

In reference to claim 5, the combined teachings of Morcom et al. and Goldstein teach wherein said backside periphery outline masking is disposed in a closed geometric pattern encircling each front side microwave radio frequency circuit die and further include a closed geometric backside annular ring of original wafer thickness semiconductor material surrounding said entire wafer of microwave radio frequency circuit die (Morcom et al., column 2, line 53 – column 3, line 6).

In reference to claims 6 and 7, the combined teachings of Morcom et al. and Goldstein teach wherein said step of removing selected thickness from said wafer backside surface etching step comprises a backside etching sequence (Morcom et al., column 2, lines 23 - 33); wherein said backside surface etching step comprises a dry gas etching step (Morcom et al., column 2, lines 23 - 33).

In reference to claim 9, the combined teachings of Morcom et al. and Goldstein teach wherein said removing step individual circuit die-strengthening upstanding surrounding bluff masked regions further include a wafer periphery-surrounding annular ring upstanding bluff region (Morcom et al., Fig.6).

Art Unit: 2823

In reference to claim 32, the combined teachings of Morcom et al. and Goldstein teach wherein said array of circuit die locations and circuit die segregation boundaries defined across a frontal surface of said semiconductor wafer and said upstanding mesa array of original wafer thickness extent across said backside surface each comprise a rectangular grid pattern (Morcom et al., Fig.6).

9. Claims 8 and 35 rejected under 35 U.S.C. 103(a) as being unpatentable over Morcom et al. ('702) in view of Goldstein ('080) as applied to claims 1-7, 9, 31-34 and 37 above, and further in view of Kohno et al. (U.S. 6,358,762 B1).

The combined teachings of Morcom et al. and Goldstein teach wherein said backside etching step includes dry etching, but fail to teach wherein said dry etching includes inductively coupled plasma. However, Kohno et al. (Figs.4A-4F) in a related method to etch semiconductor substrates teach etching said semiconductor substrate (11) using inductively coupled plasma (column 3, lines 44 - 50, column 6, lines 3 - 11 and column 9, lines 14 - 29). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Morcom et al. and Goldstein with the teachings of Kohno et al. to enable using the etching process of Kohno et al. to perform the backside etching of Morcom et al. and Goldstein.

10. Claims 22-26, 28, 30 and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Morcom et al. ('702) in view of Goldstein ('080) and Yamada et al. (U.S. 6,297,131 B1) alone or in combination with the Applicants' Admitted Prior Art.

In reference to claims 22, 26, 30 and 36, Morcom et al. (1A-6) in a related method to form ultra thin silicon wafers teach depositing a mask (4, 5) of grid pattern-

Art Unit: 2823

defining configuration on wafer (2) backside surface; said mask (4, 5) of grid patterndefining configuration determining a plurality of wafer (2) backside grid cells each aligned in surrounding periphery with one of said wafer (2) frontal surface integrated circuit devices; removing a controlled thickness (1) amount of semiconductor wafer (2) backside surface semiconductor material within each said backside grid cell, said removing including an etching step and leaving a wafer (2) backside grid pattern of semiconductor material of said semiconductor wafer (2) nominal thickness dimension and leaving a selected thickness remainder amount of said semiconductor wafer (2) nominal thickness dimension material, within each said backside grid cell, supporting said integrated circuit device; said etching step also leaving a wafer perimeter-disposed backside ring (3) of wafer semiconductor material of said semiconductor wafer (2) nominal thickness dimension and integral interconnection with said wafer backside grid pattern of wafer nominal thickness dimension; said wafer perimeter-disposed backside ring of wafer semiconductor material of said semiconductor wafer nominal thickness dimension and said wafer backside grid pattern of wafer nominal thickness dimension semiconductor material in interconnecting combination adding physical handlingassisting substantial physical integrity and rigidity to said now thinned semiconductor wafer (column 2, line 15 – column 3, line 45).

Morcom et al. fail to expressly teach fabricating electrical circuit portions of said thinned semiconductor wafer radio frequency integrated circuit device on a frontal side of a nominal thickness semiconductor wafer, each said integrated circuit device being disposed in a separate die location of said semiconductor wafer and including a plurality

Art Unit: 2823

of contact pads; forming a plurality of via hole intrusions into said nominal thickness semiconductor wafer in locations registered with selected of said contact pads of said integrated circuit device; said via hole intrusions being formed from said frontal side of said nominal thickness semiconductor wafer metallizing said via hole openings, said metallizing including establishing via metal electrical connections with selected of said contact pads; and covering said thinned semiconductor wafer backside including said wafer backside grid pattern cells with a layer of ground plane metal, said covering including forming ground plane electrical interconnections with said via hole intrusions metallization; mounting said wafer on said frontal surface thereof.

However, Goldstein (Figs.7-11 and Figs.17-20) in a related method to form semiconductor integrated circuit dies teaches fabricating electrical circuit portions of said integrated circuit device on a frontal side of a nominal thickness semiconductor wafer (91), each said integrated circuit device being disposed in a separate die location of said semiconductor wafer and including a plurality of contact pads (85); forming a plurality of via hole intrusions (84) into said nominal thickness semiconductor wafer (91) in locations registered with selected of said contact pads (85) of said integrated circuit device; said via hole intrusions (84) being formed from said frontal side of said nominal thickness semiconductor wafer; metallizing said via hole openings (84), said metallizing including establishing via metal electrical connections with selected of said contact pads (85); and mounting said wafer (91) on said frontal surface thereof (column 2, line 15 – column 3, line 45). Also, Goldstein (Figs.7-11) in another embodiment of the invention teaches thinning said semiconductor wafer (37); and covering said thinned

Art Unit: 2823

A 141 : 0000

semiconductor wafer backside including said wafer backside grid pattern cells with a layer of ground plane metal (44b, 45b), said covering including forming ground plane electrical interconnections with via hole intrusions metallization (41), including exposed portions of via hole intrusions (column 7, line 29 – column 8, line 20).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Morcom et al. and Goldstein to enable forming the circuit configuration of Goldstein in the wafer of Morcom et al. to arrive at the claimed invention.

The combined teachings of Morcom et al. and Goldstein fail to teach further processing said wafer during continued frontal surface mounting, said further processing including removing each integrated circuit device die from said wafer by wafer segregation within a lateral extent of a backside grid cell. However, Yamada et al. (Figs.1A-6) in a related method to form separated dies teach processing a wafer (30) during a continued frontal surface mounting, said further processing including removing each integrated circuit device die (30A) from said wafer (30) by wafer segregation within a lateral extent of a backside grid cell ([0040] – [0043]). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Morcom et al. and Goldstein with the teachings of Yamada et al. to enable the die separation to complete the processing of the semiconductor die.

Furthermore, by combining the teachings of Morcom et al., Goldstein and Yamada et al., semiconductor dies with improved support and reduced thickness can be

Art Unit: 2823

used for the fabrication of microwave radiofrequency dies as taught by the prior art (Instant page 1, line 16 – page 2, line 14).

In reference to claim 23, the combined teachings of Morcom et al. Goldstein and Yamada et al. teach wherein said step of forming a plurality of via hole intrusions into said semiconductor wafer includes disposing said via hole intrusions to a first depth dimension into said semiconductor wafer; and wherein said selected thickness remainder amount of said semiconductor wafer nominal thickness dimension material in said step of removing a controlled thickness amount of said wafer backside semiconductor material within each said backside grid cell comprises leaving a selected thickness remainder amount of said wafer nominal thickness equal to said via, hole intrusions first depth dimension into said semiconductor wafer (Morcom et al., column 2, line 53 – column 3, line 6.

In reference to claim 24, the combined teachings of Morcom et al., Goldstein and Yamada et al. teach wherein said semiconductor wafer of nominal thickness is between five hundred and six hundred twenty-five micrometers in thickness; and wherein said selected thickness remainder amount of said wafer nominal thickness and said via hole intrusions first depth dimension are each no more than one hundred micrometers (Morcom et al., column 3, lines 7 – 18).

In reference to claim 25, the combined teachings of Morcom et al., Goldstein and Yamada teach wherein said circuit device is comprised of field effects transistors (Goldstein, column 1, lines 21 – 35).

Art Unit: 2823

In reference to claim 28, the combined teachings of Morcom et al., Goldstein and Yamada et al. teach wherein said etching removing step comprises a dry gas etching step (Morcom et al., column 2, lines 23 – 33)

11. Claim 27 is rejected under 35 U.S.C. 103(a) as being unpatentable over Morcom et al. ('702) in view of Goldstein ('080) and Yamada et al. ('131 B1) as applied to claims 22-26, 28, 30 and 36 above, and further in view of Matsunami (U.S. 5,463,246).

The combined teachings of Morcom et al., Goldstein and Yamada et al. substantially teach all aspects of the invention but fail to teach wherein said radio frequency integrated circuit device is comprised of one of field effect, bipolar junction and heterojunction bipolar transistors; and wherein said depositing step mask is a metallic mask. However, Matsunami (Figs.2a-2d) in a related method to form field effect transistors teaches etching a semiconductor substrate (1) using a metallic mask (6) (column 6, lines 7 – 50). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Morcom et al., Goldstein and Yamada et al. with the teachings of Matsunami to enable use a metallic mask as taught by Matsunami to etch the substrate as taught by Morcom et al., Goldstein and Yamada et al.

12. Claim 29 is rejected under 35 U.S.C. 103(a) as being unpatentable over Morcom et al. ('702) in view of Goldstein ('080) and Yamada et al. ('131 B1) as applied to claims 22-26, 28, 30 and 36 above, and further in view of Kohno et al. ('762 B1).

The combined teachings of Morcom et al., Goldstein and Yamada teach wherein said backside etching step includes dry etching, but fail to teach wherein said dry

Art Unit: 2823

etching includes inductively coupled plasma. However, Kohno et al. (Figs.4A-4F) in a related method to etch semiconductor substrates teach etching said semiconductor substrate (11) using inductively coupled plasma (column 3, lines 44 – 50, column 6, lines 3 – 11 and column 9, lines 14 – 29). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Morcom et al., Goldstein and Yamada et al. with the teachings of Kohno et al. to enable using the etching process of Kohno et al. to perform the backside etching of Morcom et al., Goldstein and Yamada et al.

Conclusion

13. Papers related to this application may be submitted directly to Art Unit 2823 by facsimile transmission. Papers should be faxed to Art Unit 2823 via the Art Unit 2823 Fax Center located in Crystal Plaza 4, room 3C23. The faxing of such papers must conform to the notice published in the Official Gazette, 1096 OG 30 (15 November 1989). The Art Unit 2823 Fax Center number is (703) 305-3432. The Art Unit 2823 Fax Center is to be used only for papers related to Art Unit 2823 applications.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to **Julio J. Maldonado** at **(703) 306-0098** and between the hours of 8:00 AM to 4:00 PM (Eastern Standard Time) Monday through Friday or by e-mail via <u>julio.maldonado@uspto.gov</u>. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Olik Chaudhuri, can be reached on (703) 306-2794.
